1 PRiSM Example: German Credit Card Data

This notebook demonstrates the PRiSM (Partial Responses in Structured Models) method, which is designed to transform black-box classifiers into inherently interpretable models without compromising predictive performance. This approach is particularly valuable in high-stakes applications where understanding the model’s decision-making process is crucial.

The method addresses a key challenge in machine learning: the trade-off between model complexity and interpretability. It allows us to create models that are both accurate and transparent. In this example, we’ll use a German credit card dataset to illustrate the PRiSM method. While this isn’t a medical dataset, the principles demonstrated here are directly applicable to clinical data and decision support systems.

Here, the target outcome we are modelling is “Class label”, which refers to:

- 0: a customer who **did not default** on their loan
- 1: a customer who **did default** on their loan

We would like to use the available features to model the likelihood of a customer defaulting, and understand how each feature contributes to that likelihood.

1.1 1. Setup and Imports

First, we need to import the necessary libraries and set up our environment.

```
[ ]: %load_ext autoreload
      %autoreload 2

import numpy as np
import pandas as pd
import torch
import matplotlib.pyplot as plt
import seaborn as sns

from prism.config import RAW_DATA_DIR, MODELS_DIR
from prism.preprocessing import normalize, feature_summary, \
    plot_feature_histograms
from prism.maskedmlp import train_mlp_batched, train_maskedmlp
from prism.partial_responses import partial_responses
from prism.response_plot import plot_partial_responses
```

```

from prism.nomogram import nomogram, display_nomograms_side_by_side
from prism.lasso import lasso
from prism.device_tools import get_device, get_num_cpu_workers
from prism.metrics import evaluate_model_performance, compare_model_performance

```

The autoreload extension is already loaded. To reload it, use:

```
%reload_ext autoreload
```

```
[ ]: %reload_ext autoreload
```

We set up our computational device (CPU or GPU if available) and set a random seed for reproducibility.

We'll use the 'lebesgue' method for partial responses, which is one of two methods (the other being 'dirac') for calculating partial responses. The Lebesgue method uses an average over the predicted surface, which can be more stable for some datasets, but more computationally intensive. If you're working with a bigger dataset, or low compute resources, starting with 'dirac' may be better.

```

[ ]: # Set device to 'cpu', or GPU ('cuda' for NVIDIA, 'mps' for Apple Silicon)
# By default, we select the best available device
device = get_device()
print(f"Using device: {device}")

# Set random seed for reproducibility
random_seed = 257
np.random.seed(random_seed)
torch.manual_seed(random_seed)

# Set method and other parameters
partial_response_method = 'lebesgue'
SAVE_MODELS = False
SAVE_METRICS = True

```

Using device: cuda

For multithreading compute-intensive tasks, the recommended number of workers for GPU processing is 1, otherwise for CPU stick to the default (number of logical cores - 1). However, depending on your hardware, you may want to experiment.

```

[ ]: if device != 'cpu':
    max_workers = 1
else:
    max_workers = get_num_cpu_workers()
print(f"max_workers = {max_workers}")

```

```
max_workers = 1
```

1.2 2. Load and Preprocess Data

Next, we load the German credit card data and perform necessary preprocessing steps.

```
[ ]: from sklearn.model_selection import train_test_split
from sklearn.preprocessing import LabelEncoder
from sklearn.impute import SimpleImputer

def preprocess_german_credit_data(data, target_column, feature_columns,
    ↪test_size=0.2, random_state=257, shuffle=False, credit_scale=0.01):
    """
    Preprocess the German Credit Card dataset.

    Parameters:
    data (pd.DataFrame): The raw German Credit Card dataset
    target_column (str or int): The name or index of the target column
    feature_columns (list): List of column names or indices to use as features
    test_size (float): Proportion of the dataset to include in the test split
    random_state (int): Random state for reproducibility

    Returns:
    tuple: X_train, X_test, y_train, y_test (all as pd.DataFrame or pd.Series)
    """
    # Select features and target
    if isinstance(target_column, int):
        target_column = data.columns[target_column]

    if all(isinstance(col, int) for col in feature_columns):
        feature_columns = data.columns[feature_columns]

    X = data.copy()[feature_columns]
    y = data[target_column]

    # Scale the 'Credit amount' if it exists in the dataset
    if 'Credit amount' in data.columns:
        X['Credit amount'] = X['Credit amount'] * credit_scale
        X['Credit amount'] = X['Credit amount'].round()

    # Encode categorical variables
    label_encoder = LabelEncoder()
    for column in X.select_dtypes(include=['object']):
        X[column] = label_encoder.fit_transform(X[column].astype(str))

    # Impute missing values
    imputer = SimpleImputer(strategy='median')
    X = pd.DataFrame(imputer.fit_transform(X), columns=X.columns)

    # Split the data into training and testing sets
    X_train, X_test, y_train, y_test = train_test_split(X, y,
    ↪test_size=test_size, random_state=random_seed, shuffle=shuffle)
```

```

# Ensure the target variable is binary
y_train = (y_train == y_train.max()).astype(int)
y_test = (y_test == y_test.max()).astype(int)

return X_train, X_test, y_train, y_test

```

```

[ ]: # Load data
german_credit_data = pd.read_csv(RAW_DATA_DIR.joinpath('GermanCC_attributes.
↳csv'))

target_column = 'Class label'
feature_columns = [0, 1, 2, 4, 5, 6, 13, 19, 20, 21] # List of column indices↳
↳to use as features

X_train, X_test, y_train, y_test = preprocess_german_credit_data(
    german_credit_data,
    target_column,
    feature_columns,
    credit_scale=0.01,
    test_size=0.3,
    random_state=random_seed
)

# Normalize the data to ensure all features have a median of zero
X_train_normalized, X_test_normalized = normalize(X_train, X_test)

# Convert to tensors for use with PyTorch
X_train_tensor = torch.tensor(X_train_normalized.values, dtype=torch.float32,↳
↳device=device)
X_test_tensor = torch.tensor(X_test_normalized.values, dtype=torch.float32,↳
↳device=device)
y_train_tensor = torch.tensor(y_train.values, dtype=torch.float32,↳
↳device=device)
y_test_tensor = torch.tensor(y_test.values, dtype=torch.float32, device=device)

feature_names = [
    'Account Status',
    'Duration (Months)',
    'Credit History',
    'Credit Amount',
    'Savings/Bonds',

    'Unknown1',
    'Unknown2'
]

```

1.3 3. Data Overview

Before building our models, we'll get an overview of our data.

```
[ ]: print("Shape of training data:", X_train.shape)
      print("Shape of testing data:", X_test.shape)
      print("\nClass distribution in training set:")
      print(y_train.value_counts(normalize=True))
      print("\nClass distribution in test set:")
      print(y_test.value_counts(normalize=True))
```

Shape of training data: (700, 10)

Shape of testing data: (300, 10)

Class distribution in training set:

Class label

0 0.704286

1 0.295714

Name: proportion, dtype: float64

Class distribution in test set:

Class label

0 0.69

1 0.31

Name: proportion, dtype: float64

```
[ ]: feature_stats = feature_summary(X_train, categorical_threshold = 15)
      print("Feature Statistics:")
      print(feature_stats)
```

1.4 4. Train Initial Black Box Model (MLP)

We start by training a black box model, in this case, a Multi-Layer Perceptron (MLP) with 10 nodes in the hidden layer. This model serves as our baseline and represents the type of complex, hard-to-interpret model that is often used in machine learning.

```
[ ]: mlp_hyperparameters = {
    'n_hidden': 10,
    'weight_decay': 0.0001,
    'lr': 0.001,
    'patience': 10,
    'tolerance': 0.00001,
    'batch_size': 32,
    'device': device,
    'seed': random_seed
}
```

```
blackbox_model = train_mlp_batched(X_train_normalized, y_train,  
    ↪X_test_normalized, y_test, **mlp_hyperparameters)
```

1.5 5. Calculate Partial Responses

Now we calculate partial responses for our black box model. This is a key step in the PRiSM method. Partial responses help us understand how individual features or pairs of features contribute to the model's predictions, making the black box model more interpretable.

```
[ ]: partial_responses_params = {
    'x_train': X_train_tensor,
    'method': partial_response_method,
    'device': device,
    'batch_size': 512,
    'max_workers': max_workers
}

partial_responses_train = partial_responses(X_train_tensor, blackbox_model,
    ↪**partial_responses_params)
partial_responses_test = partial_responses(X_test_tensor, blackbox_model,
    ↪**partial_responses_params)
```

1.6 6. Perform LASSO on Partial Responses

We use LASSO (Least Absolute Shrinkage and Selection Operator) to select the most consequential partial responses. This step helps us identify which features or feature interactions contribute most to the model's predictions. A range of regularization strengths (λ) are used, and for each one a logistic regression model with LASSO regularization is trained and evaluated. Based on the results, we can choose the most suitable λ , balancing model performance against the total number of selected features.

```
[ ]: lasso_results = lasso(  
    partial_responses_train,  
    partial_responses_test,  
    y_train,  
    y_test,  
    feature_names=feature_names,  
    nlambdas=25,  
    min_lambda=0.1,  
    max_lambda=100,  
    batch_size=2,  
    seed=random_seed  
)
```

<IPython.core.display.HTML object>

All fits converged successfully.

```
[ ]: lasso_results.plot_lambda_path()
lasso_results.select_lambda(18) # Adjust lambda selection as needed
lasso_results.plot_feature_importance()
```

1.7 7. View Selected Partial Responses and Generate Nomogram

First, we visualize the contribution of each partial response selected with LASSO to the target value.

```
[ ]: fig_blackbox = plot_partial_responses(  
    lasso_results,  
    X_train_tensor,  
    X_train.median().values,  
    X_train.std().values,  
    blackbox_model,  
    n_steps=15,  
    sd_scale=2,  
    method=partial_response_method,  
    device=device,  
    categorical_threshold=15,  
    subtract_univariate=True,  
    figsize=(15,20),  
    show_fig=True,  
    return_fig=True,  
    use_odds_ratio=True  
)
```

We can also visualize the contribution of each partial response using a nomogram. Nomograms are particularly useful in clinical settings as they provide an intuitive visual representation of a model's

decision-making process.

```
[ ]: nomogram_params = {
    'n_steps' : 15,
    'sd_scale' : 2,
    'method' : partial_response_method,
    'device' : device,
    'categorical_threshold' : 15,
    'subtract_univariate' : True,
    'return_fig' : True,
    'use_odds_ratio' : True,
    'save_csv' : SAVE_METRICS,
    'csv_comment' : "MLP German CC data"
}

nomogram_results = nomogram(
    lasso_results,
    X_train_tensor,
    X_train.median().values,
    X_train.std().values,
    blackbox_model,
    **nomogram_params
)
nomogram_main_mlp = nomogram_results[6]
nomogram_non_mixed_mlp = nomogram_results[7]
```

Nomogram of univariate and mixed bivariate partial responses (Lebesgue)

Nomogram of non-mixed bivariate partial responses (Lebesgue)

1.8 8. Train Partial Response Network (PRN)

Now we train a Partial Response Network based on the selected features. The PRN is a type of neural network that incorporates the interpretability of partial responses while maintaining the predictive power of the original black box model.

From the results of the lasso feature selection, we create an input mask for the PRN. The mask is a binary matrix that determines which input features connect to which hidden nodes (subnets) in the network. This enforces the network structure based on selected features.

The PRN uses a subnet architecture, where groups of hidden nodes are dedicated to specific features or feature interactions:

- Univariate subnets: Handle individual feature effects
- Bivariate subnets: Capture interactions between two features
- The number of nodes per subnet is controlled by the `subnet_nodes` parameter in `train_maskedmlp` (default 5)

This gives us a resulting network structure as follows

- Input layer: Original features
- Hidden layer: Structured into subnets based on the mask
- Output layer: Single node for binary classification

The resulting PRN maintains interpretability because each subnet corresponds to a specific feature or interaction. Therefore, contribution of each feature/interaction can be analyzed separately, and the overall prediction is a sum of these interpretable components.

```
[ ]: mask, n_features = lasso_results.get_mask()
```

```
Selected features: ['Account Status', 'Duration (Months)', 'Credit History',  
'Credit Amount', 'Savings/Bonds', 'Employment Length', 'Other Plans', 'Foreign  
Worker', 'Unknown1', 'Unknown2', 'Account Status : Employment Length', 'Account  
Status : Other Plans', 'Duration (Months) : Credit Amount', 'Duration (Months) :  
Savings/Bonds', 'Credit History : Other Plans', 'Credit Amount : Unknown2',  
'Employment Length : Other Plans', 'Other Plans : Unknown1']
```

```
[ ]: prn_hyperparameters = {
    'n_hidden': n_features,
    'mask': mask,
    'subnet_nodes': 5,
    'iter': 10000,
    'lr': 0.001,
    'weight_decay': 0.00001,
    'tolerance': 0.00001,
    'patience': 100,
    'device': device,
    'seed': random_seed
}

partial_response_network = train_maskedmlp(X_train_normalized, y_train,
↪X_test_normalized, y_test, **prn_hyperparameters)
```

---- Model Performance Metrics PRN - train data ----

Threshold (prevalence) set to: 0.296

AUROC: 0.829 (95% CI: 0.795-0.858) (Area Under the Receiver Operating Characteristic curve)

Accuracy: 0.736 (Proportion of correct predictions)

Precision: 0.536 (Proportion of true positives among positive predictions, aka PPV)

Recall: 0.792 (Proportion of true positives among actual positives, aka sensitivity)

F1 Score: 0.639 (Harmonic mean of precision and recall)

----- Model Performance Comparison -----

Threshold (prevalence) set to: 0.296

MLP:

AUROC: 0.808 (95% CI: 0.751-0.858)

Accuracy: 0.723

Precision: 0.540

Recall: 0.720
F1 Score: 0.618

PRN:
AUROC: 0.821 (95% CI: 0.768-0.869)
Accuracy: 0.717
Precision: 0.531
Recall: 0.742
F1 Score: 0.619

1.9 9. LASSO on PRN

We perform LASSO again, this time on the Partial Response Network to isolate the most important features and interactions.

```
[ ]: partial_responses_params_prn = {
    'x_train': X_train_tensor,
    'method': partial_response_method,
    'device': device,
    'batch_size': 256,
    'max_workers': max_workers
}

partial_responses_train_prn = partial_responses(X_train_tensor,
    ↪ partial_response_network, **partial_responses_params_prn)
partial_responses_test_prn = partial_responses(X_test_tensor,
    ↪ partial_response_network, **partial_responses_params_prn)
```

MLP
Nomogram of non-mixed bivariate partial responses (Lebesgue)

PRN
Nomogram of non-mixed bivariate partial responses (Lebesgue)

1.11 11. Evaluate PRN-LASSO Model

Finally, we evaluate the simplified model (multivariate logistic regression with LASSO regularization) trained on the partial responses of the PRN, based on the selected lambda.

This notebook demonstrates the PRiSM method, transforming a black box model into an interpretable one without sacrificing predictive performance. This approach is particularly valuable when understanding the model's decision-making process is crucial for building trust and gaining insights.

The final PRN-LASSO model provides both high predictive accuracy and interpretability, allowing us to understand how different features contribute to the predictions.

```
[ ]: prn_lasso = lasso_results_prn.get_selected_model()
```

Logistic regression model for Lambda index 38 (2.88) selected.

```
